Also, a variety of pyrazolylquinazolines 19 – 21, pyrimidinylquinazolines 22a,b were obtained via a sequence of heterocyclization reactions of 4-methyl-N-[4-(4-oxo-3,4-dihydroquinazolin-2-yl)phenyl]benzenesulfonamide (2) with different reagents. The new compounds were synthesized with the objective of study their antimicrobial activity.

Introduction

Quinazoline derivatives and heterocyclic annelated quinazolines are reported to be physiologically and pharmacologically active [1], which exhibit a wide rang of activities as anticonvulsant, anti-inflammatory, antifungal, antimalarial and sedative [2 – 6]. Some of these compounds are identifies as drugs [7], such as quinethazone and metolazone are used in medicine as diuretics while prazosin is a vasodilator which is also used as antihypertensive drug. Moreover, sulfonamide derivatives have been widely used as bacteriostatic agents [8, 9]. Prompted us by above mentioned facts and in conjunction with our ongoing program on the utility of readily obtainable starting material for the synthesis of heterocyclic systems of biological interest [10 – 13]. We have decided to synthesis a series of novel annelated quinazoline derivatives having sulfonamide moiety with potential wide spectrum of biological responses.

Results and Discussion

The target compound, 4-methyl-N-[4-(4-oxo-4H-3,1-benzoazin-2-yl)-phenyl]benzenesulfonamide (1) was readily obtained from cyclization of 2-[4-(toluene-4-sulfonylamino)benzoylamino]benzoic acid by boiling in acetic anhydride [14]. The structure of the reaction product 1 was supported by elemental analyses and compatible spectroscopic data. Thus, its IR spectrum showed absorption bands at 3260 (ν\(\text{NH}\)), 1745 (ν\(\text{CO}\)) and 1440, 1370 cm\(^{-1}\) (ν\(\text{SO}_2\)). The \(^1\)H NMR spectrum (CDCl\(_3\)) showed signal (3H) at δ = 2.36 ppm assigned for methyl protons, a multiplet signals (12H) at (6.96 – 8.11 ppm) assigned for the aromatic protons and signal at 10.11 ppm assigned for NH which disappeared upon addition of D\(_2\)O to NMR sample and its mass spectrum revealed a molecular ion peak at m/z (\%) = 392 (M\(^+\)) corresponding to the molecular formula C\(_{21}\)H\(_{16}\)N\(_2\)O\(_4\)S. Fusion of benzoxazinone derivative 1 with ammonium acetate in an oil bath at 160 – 170 °C afforded 4-methyl-N-[4-(4-oxo-3,4-dihydroquinazolin-2-yl)phenyl]benzenesulfonamide (2) which is a promising intermediate for the synthesis of a diverse annelated quinazoline derivatives. Reaction of compound 2 with a mixture of phosphorus pentachloride/phosphorus oxychloride on a water bath yielded 4-chloroquinazoline derivative 3 in fairly good yield, which upon subsequent reaction with hydrazine hydrate in refluxing n-butanol furnished the target compound, 4-hydrazinoquinazoline derivative 4 (Scheme 1).

As the preparation of novel tricyclic and tetracyclic systems is the main goal of this synthetic program, hydrazinoquinazoline was used as a precursor for the synthesis of triazinoquinazoline derivatives of biological applications [15 – 17]. Thus, the cyclocondensation of compound 4 with α-haloketones (viz. chloroacetone and phenacyl bromide) in dry xylene gave tetraaza-
phenanthrene derivatives 5a,b. Also, the reaction of compound 4 with ethyl chloroacetate yielded 4-methyl-N-[4-(2-oxo-2,3-dihydro-1H-3,4,9,10a-tetraazaphenanthren-10-yl)phenyl]benzenesulfonamide (6). Moreover, tetraazaphenanthrene-1,2-dione 7 was also obtained from the reaction of compound 4 with diethyl oxalate in absolute ethanol. Reaction of compound 4 with aromatic aldehydes (viz. benzaldehyde and p-chlorobenzaldehyde) gave quinazoline derivatives 8a,b. Cyclocondensation reaction of 8b with 2-mercaptoacetic acid in presence of catalytic amount of piperidine yielded thiazolidinone derivative 9 via nucleophilic addition of sulfur atom to activated C=N bond followed by cyclization to give 9 (Scheme 1).

Furthermore, chloroquinazoline 3 was also used for construction of novel triazinoquinazoline derivative 11 via the reaction of compound 3 with ammonium thiocyanate in dry acetone to afford the non-isolable intermediate 10, which reacted in situ with phenyl isocyanate to yield triazinoquinazoline derivative 11 (Scheme 2).

The structure of compound 11 was confirmed by its mass spectrum which showed a molecular ion band at m/z (%) = 551 (M+) for molecular formula C_{29}H_{21}N_{5}O_{3}S_{2}, in addition to IR spectrum which showed absorption band at 3320 (ν_{NH}), 1680 (ν_{CO}) and at 1265 cm^{-1} (ν_{CS}). This contribution was extended to study some nucleophilic substitution reactions with chloroquinazoline 3 for construction...
a novel heteroaromatic systems. Thus, fusion of compound 3 with anthranilic acid in an oil bath at 165 – 175 °C afforded 4-methyl-N-[[4-(8-oxo-8H-quinazolino[4,3-b]quinazolin-6-yl)-phenyl]benzenesulfonamide (12).

Treatment the chloroquinazoline 3 with the sodium salt of various amino acids (viz. glycine and alanine) under reflux, the corresponding quinazolinylamino acids 13a,b were obtained. The amino acid derivatives 13a,b were easily cyclized [18] by boiling in acetic anhydride in presence of anhydrous sodium acetate to yield imidazoquinazoline derivatives 14a,b. Incorporation of imidazolyl moiety in the quinazoline ring was also achieved by fusion of compound 3 with o-phenylenedi amine to afford N-(4-[1,3]benzimidazo[1,2-c]quin azolin-6-ylphenyl)-4-methylbenzenesulfonamide (15) (Scheme 2).

The behavior of chloroquinazoline towards active methylene compounds was also studied with respect to the synthesis of highly substituted pyrazoles and pyrimidines [19, 20]. Thus, the treatment of compound 3 with active methylene compounds (viz. malononitrile, ethyl cyanoacetate, ethyl acetoacetate and acetylacetone) afforded the corresponding quinazoline derivatives 16 – 18, respectively (Scheme 3). The infrared spectrum of compound 16 showed the presence of absorption peaks at 3310 due to (νNH) and 2225 – 2215 cm⁻¹ due to (2C≡N).

The condensation of compounds 16-18 with hydrazine hydrate in refluxing absolute ethanol yielded the pyrazolylquinazoline derivatives 19 – 21, respec-
The infrared spectrum of compound 19 showed the absence of nitrile functional group and the presence of only NH/NH₂ groups. Moreover, the reaction of compound 18 with equimolar amounts of urea or thiourea, in refluxing ethanolic sodium ethoxide solution, provided the corresponding pyrimidinylquinazoline derivatives 22a,b (Scheme 3). The structures of the synthesized compounds were assigned on the basis of elemental analysis and spectral data (cf. Experimental Section).

### Antimicrobial activity

The antimicrobial activities of some synthesized compounds were determined in vitro using hole plate and filter paper disc methods [21]. A variety species of gram positive and gram negative bacteria in addition to some fungal plant pathogens were used. Also, a comparison between the activity of our synthesized compounds and sulphadiazine as standard drug was discussed. The tested compounds were dissolved in 10% acetone (V/V), and different concentrations have been chosen (125, 250, 500 µg/ml). A qualitative screen was performed on all compounds while quantitative assays were done on active compounds only. The results are summarized in Table 1.

It is apparent from the data listed in Table 1, the antimicrobial activity of the most synthesized compounds, 5a, 6, 7, 9, 11, 19, 21, 22b were highly active against gram+ve and gram –ve bacteria but showed moderate activity against the selected fungi as compared by reference drug used. The high activity of the tested compounds due to the incorporation of triazine, thiazole, pyrazole and pyrimidine moieties to quinazoline ring in addition to sulfonamide moiety.

On the other hand, the compounds 12, 13a, 14a, 16 are moderately active towards bacteria and fungi as compared with standard drug due to the introduction of polynuclear nonmixed heterocyclic systems to the quinazoline ring.

In summary, the ability of quinazoline derivative 2 was demonstrated to undergo annelation reactions un-
under rather mild conditions providing an efficient synthetic methods for the preparation of various quinazoline derivatives of enhanced biological activity.
