## Methods

DPV studies were performed at room temperature in dry DMF under Argon atmosphere in the presence of tetrabutylammonium tetrafluoroborate $\left(0.1 \mathrm{~mol} \mathrm{~L}^{-1}\right)$ as conducting salt using an Autolab (PGSTAT 302N, Eco Chemie). Working electrode was a platinum disk electrode (Eco Chemie, $d=2 \mathrm{~mm}$ ), the counter electrode a laboratory-made Pt plate electrode. Via 3 M KCl salt bridge the reference electrode $\mathrm{Ag} / \mathrm{AgCl} / 3 \mathrm{M} \mathrm{KCl}$ (Sensortechnik Meinsberg GmbH) was connected. All in this paper mentioned potentials were measured with regard to this reference system and were checked by using the ferrocen/ferrocenium internal reference system. The CV scans were done three times at a scan rate of $25 \mathrm{mV} \mathrm{s}^{-1}$. The differential pulse voltammograms were performed in oxidative and in reductive direction with a scan rate of $5 \mathrm{mV} \mathrm{s}^{-1}$ (step potential 2.5 mV , modulation amplitude 25 mV , modulation time 0.05 s , interval time 0.5 s ). Concentrations of $1 \mathrm{mmol} \mathrm{L}^{-1}$ analyt were used for the measurements.

Theoretical calculations The optimization of the structures and electrostatic potential surface were calculated with the 6-31g* basis sets and the Becke3LYP density functional method ${ }^{1,2}$ by using the GAUSSIAN-09 Package. ${ }^{3}$ For B3LYP method the Becke-3 parameter gradient corrected exchange functional is combined with the gradient-corrected correlation LYP functional by Lee, Yang and Parr. No imaginary frequencies were found indicating that all geometries represent at least local minimum structures on the potential energy surface. The calculation of the 30 electron transition states requires the solutions of the time dependent Schrödinger equations and was carried out by using the time dependent density functional theory (TD-DFT) method with the B3LYP functional. Orbitals and energies, atomic charges, vibrational modes and thermodynamic properties were chosen as output parameters. HOMO and LUMO orbital surfaces and electrostatic potential density maps then obtained from the output. Additionally we calculated the natural atomic charges by applying the NBO program as implemented in Gaussian 09., ${ }^{3,4}$ All calculations have been carried out on the HPPCCluster in Rostock.

## Solvatochromic spectra

## Definition of the solvatochromic parameters of Kamlet and Taft

The description is made based on the Kamlet-Taft LSE (linear solvation energy) equation (1):

$$
\begin{equation*}
\mathrm{XYZ}=\mathrm{XYZ}_{0}+a \alpha+b \beta+s\left(\pi^{*}+d \delta\right) \tag{1}
\end{equation*}
$$

XYZ: band parameter where solvatochromatism takes place
$\mathrm{XYZ}_{0}$ : band parameter where solvatochromatism does not take place
$a, b, d, s: \quad$ solvent-independent coefficients which reflect the susceptibility of the polarity terms upon XYZ
$\pi^{*}: \quad$ polarity/polarisability
$\alpha: \quad$ hydrogen bond donor (HBD) ability
$\beta: \quad$ hydrogen bond acceptor (HBA) ability
$\delta: \quad$ polarisability correction term (1.0 for aromatic, 0.5 for polyhalogenated and zero for nonchlorinated aliphatic solvents)
$\alpha$ and $\beta$ give the opportunity to distinguish between solvent-to-solute and solute-to-solvent hydrogen bonds.

Thus, except for dichloromethane is $\delta=0$ and the coefficient d is mostly zero or finite negative. Hence a simplified equation can be used (2):

$$
\begin{equation*}
\mathrm{XYZ}=\mathrm{XYZ}_{0}+a \alpha+b \beta+s \pi^{*} \tag{2}
\end{equation*}
$$

## Selected solvent properties

Table S1. Selected solvent properties.

| solvent | Polarity | HBD | HBA | Dielectric <br> constant | Dipole <br> moment |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\boldsymbol{\pi}^{*}$ | $\boldsymbol{\alpha}$ | $\boldsymbol{\beta}$ | $\boldsymbol{E}$ | $\boldsymbol{D}$ |
| $n$-Hexane | -0.08 | 0.00 | 0.00 | 1.89 | - |
| Ethyl acetate | 0.55 | 0.19 | 0.45 | 6.02 | 1.78 |
| Dioxane | 0.55 | 0.00 | 0.37 | 2.21 | 0.45 |
| Tetrahydrofurane | 0.58 | 0.00 | 0.55 | 7.50 | 1.75 |
| Dichloromethane | 0.82 | $(0.30)$ | 0.00 | 8.93 | 1.60 |
| Dimethylformamide | 0.88 | 0.00 | 0.76 | 36.70 | 3.82 |
| Acetonitrile | 0.75 | 0.00 | 0.35 | 37.50 | 3.92 |
| Dimethylsulfoxide | 1.00 | 0.00 | 0.76 | 46.68 | 3.96 |

## Theoretical calculations

Table S2. The B3LYP/6-31g*optimized geometries, the Cartesian coordinates are given in $\AA$.
